Q: What is the meaning of the terms 'initial and final' in the following equation? I am trying to understand a blog post regarding matrix Lie algebra valued Lie algebra in representation theory from here: At one point I am reading about the differential of a matrix valued map $A : M \rightarrow M^*$ as: $\delta A = A \otimes dx$ where $A \otimes dx$ is a section of $(A \otimes dx) \otimes T_x M$ where $A \otimes dx$ is a section of $(A \otimes dx) \otimes T_x M$ for $x \in M$. What is it that $(A \otimes dx)$ means? I am assuming that it is the matrix action of A on a vector dx but what would be $(A \otimes dx)$? What is the meaning of the words 'initial and final' in the following equation: $\delta A = A \otimes dx = A \otimes \{\partial_x\}$ where $A \otimes dx = A \otimes \{\partial_x\}$ for $x \in M$? Where is M ? A: First of all, dx is the left logarithmic differential of M in $\mathrm{Der}(M)$, and dx denotes the vector field that sends x to dx . $(A \otimes dx)$ denotes the section of $\mathrm{Hom}(A \otimes \mathrm{Der}(M), M)$ with value $A \otimes dx$. Here, A acts on dx (this amounts to picking a linear isomorphism $\mathrm{End}(M) \cong \mathrm{Der}(M)^*$), by using the correspondence between the dual vector space and the dual space associated to the endomorphism, and dx is kept as a vector in $\mathrm{Der}(M)^*$ with coordinates. Note that this tensor product is not really a tensor product in the same way as the former one, but rather it has the same roles
