I would like to display the generated code for cases of literals in my assembly, and I'm trying to determine which method of calculation to use. For example, Visual Studio calculates these using the value-of operator: int x=2; const int y=1; static __int64 z=x+y; In inline assembler output for this type of expression, the value of z is 10.0 (Hex) (base 16, Radix=2), or an 8-bit signed integer value. I've tried the following methods: T0(s1) = (T0(s0) + s1) T0(s1) = (T0(s0) + (s1+1)) T0(s1) = (T0(s0) + (s1 570a42141b
