The Photomerge feature is a tool that you can get to quickly through the camera or an image file. Photomerge takes multiple source images and merges them together into a single, composite image. The following steps show you how to merge a few images in Adobe Photoshop: 1. **Open your image by clicking it in the Images panel.** 2. **Click the Photomerge button (see** [Figure 7-1](#) **).** The tool bar opens and the preview at the lower right side of the window changes. Photomerge opens a preview window where you can see all of your source images merged. 3. **Right-click any of the previews and choose the Merge Down function from the context menu that appears.** Photomerge merges the source images into one layer that you can manipulate. 4. **Drag a selection handle around a section of the merged image, or select an entire section with a paintbrush.** You can move the selection anywhere on the image. 5. **Click the layer icon at the top of the Layers panel and delete the merged source images.** Photomerge leaves one merged image and doesn't delete the source images. **FIGURE 7-1:** The Photomerge button is the easiest way to merge multiple images into one. ## Using the Liquify Filter Using a tool that enables you to directly manipulate an image, such as Photoshop's Liquify feature, is a great way to sharpen or soften an image. You can always select some of the tools later in Photoshop to apply these effects. **Figure 7-2** shows an example of liquify in action. The image was sharpened by using the Spherize

Q: Finding a basis for a cayley transform Let $R: P_n(\mathbb{R}) \rightarrow GL(n, \mathbb{R})$ be the cayley transform of $P_n(\mathbb{R})$, i.e. $\mathcal{C}(p(t)) = \frac{tp(t)-p(-t)}{t^2+1}$ Find a basis for the subspace: $\{C(p(t)) \mid p(t) \in P_n(\mathbb{R})\} \subseteq GL(n, \mathbb{R})$ My attempt: I know the basis of $P_n(\mathbb{R})$ is formed by the monomials $t^k, t^{k-1}(t-1), \dots, 1$. Thus, if $p(t)$ is a polynomial, we have: $p(t) = \sum_k a_k t^k$, with $t^{n+1} = 0$ Then, by doing a cayley transform we have: $R(p)(t) = \sum_k a_k t^k$ with $t^{n+1} = 0$ Now, the problem is: since $t^{n+1} = 0$, doesn't it follow that we have $a_1 = a_2 = \dots = a_n = 0$? How can I find a basis for this subspace? A: The problem is that as with any subspace K of $P_n(\mathbb{R})$, the vectors that are in K , are the same as those that are in the linear span of K . So yes, $R(p)(t) = \sum_k a_k t^k$ with $t^{n+1} = 0$ is the same as $\sum_k a_k t^k$. But then $R(p)(t)$ is a polynomial (of degree at most $n-1$) with leading coefficient $a_n = 0$, which is a contradiction. Note that this argument also works if K is a subspace of $P_n(\mathbb{C})$
