So, our order would be: 5 7 11 17 13 17 I've calculated the first five times by subtracting the number of characters of the previous print from the current print. I haven't changed the first result, as this is the least significant of the six prints. Note that I've used - for the subtraction, so that you don't get a negative number if the last print is longer. For printing, you need to do six print operations per output line. So, the first print shows firstline, then firsttwo, firstfour, firstfive, firstsix, and finally the last. This program prints the first seven lines of the file in the one output: #include #include #include #include #include void Print(const std::string& s) { std::cout > std::noskipws; 570a42141b
