Affinity Designer Affinity Designer (www.affinity.com) is another free-to-download program that resembles Photoshop in look and feel. Its program interface is similar to that of Illustrator, but it works differently. It allows you to import and export vector files for print and online use. Like Photoshop, Affinity Designer is layer-based, like Illustrator, so you can drag and move layers around. You can crop, scale, and change the color, angle, and opacity of a layer. You can also add and edit a path, shape, or text, as you can in Illustrator. Affinity Designer is more text-based than Photoshop and Illustrator; however, you can add, rename, or delete a layer, and you can print, save, or export to file. Affinity Designer supports layers. You can adjust the opacity

Anticipatory postural adjustments in the elderly. Anticipatory postural adjustments (APAs) were quantified by recording EMG activity of the soleus and tibialis anterior muscles to examine their characteristics in the elderly. In addition to the main components of the APA, consisting of two silent steps (preparatory and anticipatory step), two main features were found: a shortening of the preparatory step in standing (p less than 0.05) and a longer silent step preceding the anticipatory step (p less than 0.02). Both APAs were found to be about 0.6 times longer than the corresponding components of the APA in young subjects, suggesting a reduced effort in the elderly. The significance of APAs in elderly persons is discussed. Sex differences in the olfactory bulb, olfactory tubercle and piriform cortex after neonatal treatment with or without early postnatal stress. It has been reported that early-life stress (e.g. maternal deprivation) can modify central nervous system functions in ways that may alter the ability of an organism to cope with challenges later in life. The aim of the present study is to evaluate changes in the central olfactory system in adult rats after early maternal deprivation and/or early postnatal treatment of stress using a 2×2 design. Pups were separated from the mother and had their eyes covered for 3 h/day from postnatal day (PND) 2 to 9. On PNDs 15-16, PNDs 22-23 and 70-71 the rats were sacrificed and the olfactory bulb, olfactory tubercle and piriform cortex were processed for Nissl staining and Fos immunocytochemistry. Results indicate that maternal deprivation significantly decreases the number of Fos-positive cells in both the piriform cortex and the olfactory tubercle of adult male rats. The number of Fos-immunopositive cells in the piriform cortex, but not in the olfactory tubercle, of adult female rats is also decreased after maternal deprivation. In contrast, early postnatal treatment of stress increases the number of Fos-positive cells in the olfactory bulb and the piriform cortex of both sexes. The number of Fos-positive cells in the olfactory tubercle of adult males is increased after early postnatal stress. In summary, these results show an effect of sex on the responses to early-life stress of the central olfactory system

Russian Cyberattack Retargets U.S. Power Grid So far, the U.S. government's attempts to punish state-linked hackers and protect its critical infrastructure have been relatively modest. But this week's Chinese hack, and a new congressional hearing on the vulnerability of American infrastructure, may serve as a wakeup call for the U.S. government. On March 5, Bloomberg News reported that hackers connected to the Russian military unit responsible for the 2016 U.S. presidential election had sent malicious software to U.S. energy companies in October and November. That software was also capable of causing physical damage to the U.S. power grid. This week, hackers linked to the Russian military unit linked to the 2016 U.S. presidential election were caught potentially targeting U.S. critical infrastructure. It's not the first time Russian hackers have targeted America's infrastructure. In 2014, the U.S. government said Russian hackers had targeted the U.S. electric grid. More recently, hackers linked to the Russian military unit at the center of the recent U.S. presidential election also targeted U.S. power companies, the Wall Street Journal reported on April 25. In 2016, Reuters and Bloomberg News reported that Russian hackers had targeted the U.S. energy companies U.S. Grid, PJM Interconnection, and the Edison Electric Institute. The government responded to these earlier attacks with relatively modest restrictions on foreign actors' powers. The Obama administration sanctioned 12 of the hackers involved with these previous attacks and put tighter sanctions on several other Russian hackers. Reuters reported on April 25 that the Trump administration has yet to take similar measures. Without the threat of a full-scale cyberwar with Russia, the U.S. government might not spend as much time and energy trying to punish those involved in these attacks. Indeed, the Obama administration has taken a lot of heat for its response to Russian hacking, as the questions are more about how the government would respond in a real cyberwar rather than an offensive hacking attempt. The Obama administration promised in 2014 that it would respond to such an attack with "proportional" measures. Still, the U.S. government didn't act on the 2014 Russian hacking until March 2016, and that came after Russian hackers stole emails from the Democratic National Committee. In March, when the D.C. Circuit Court of Appeals blocked the president's
