Pharmacokinetics of rebamipide in healthy volunteers after oral administration of a single and multiple dose. Rebamipide is a gastroprotective agent with mucoprotective, cytoprotective, and anti-inflammatory properties. The aim of the present study was to investigate the pharmacokinetics of rebamipide in healthy Japanese male volunteers after a single and multiple oral administration of a 10 mg rebamipide tablet. Fifteen healthy male volunteers participated in the study. Blood samples were taken before and at various time intervals after the oral administration of a single or multiple dose of rebamipide. The concentration of rebamipide was determined using a liquid chromatographic-tandem mass spectrometric method. The mean bioavailability of rebamipide at steady state was 41.4%. The mean C_{max} and AUC(0-∞) were 4.5 mg/L and 53.7 mg·h/L, respectively. The mean half-life was 4.0 hours. Rebamipide was well tolerated. A dose of rebamipide of 10 mg once daily is suggested for treatment of gastric ulcers.
