Field of the Invention The present invention relates generally to cell surface receptors, and their use in diagnosis and therapy. More particularly, the invention concerns a novel cell surface receptor which is related to and different from the classical T and B cell surface markers (i.e., the CD3 and CD19 surface markers), and which has been previously unrecognized. The receptor of the invention has been designated the CD80 receptor. 2. Description of the Related Art The detection of tumor antigens in general has been limited to tumor specific surface markers (i.e., MHC class I and II antigens) and cell surface-expressed growth factors or oncofetal antigens. There is a large body of evidence that these markers are not always detectable in the same tumor, and may not be detectable in early tumors.

Downloading Firmware 1) Select a target unit and connect to it. The production, market and applications of carbon nanotubes: A review. Carbon nanotubes (CNT) are a novel nanomaterials that have been extensively investigated due to their unique physical and chemical properties. In the past few years, the applications of CNT have become more and more widespread, and we are facing several challenges in their research and development. This review introduces the present state-of-the-art of the production, market, and applications of CNT, with a focus on their unique characteristics and applications for gas sensing, water purification, energy storage and conversion, medicine, electronic devices, and the environment. This review is organized into seven sections: (a) general properties of CNT; (b) different CNT synthesis methods; (c) production of CNT by chemical and thermal methods; (d) production of CNT by different biosynthesis methods; (e) the applications of CNT in energy storage and conversion; (f) the applications of CNT in gas sensing, water purification, medicine, electronic devices, and the environment; and (g) the future direction of CNT applications. We will also introduce some considerations about the research directions, market prospects, and related regulations of CNT production, market, and applications. This review is expected to be helpful for researchers, technicians, and other individuals who are interested in CNT.// // Generated by class-dump 3.5 (64 bit). // // class-dump is Copyright (C) 1997-1998, 2000-2001, 2004-2013 by Steve Nygard. // #import d0c515b9f4

^a^ The use of the term "mammary gland" rather than "breast" is a common terminology in the literature \[@B34-animals-07-00034\]. ^b^ Not tested (all 64 bitches produced a litter) ^c^ These bitches were members of the study population but did not breed and were excluded from this analysis, and consequently did not contribute to the total number of dogs in the study population (\*n\* = 64). Chromatin and DNA damage in the proximal gastrointestinal tract of pre- and post-natal mice. Mammalian pups experience large differences in the extracellular chemical environment and, as a consequence, diverse levels of exposure to potentially mutagenic substances and stress. The proximal gastrointestinal tract (GIT) is an important target for exogenous chemicals, and relevant mutagenicity and genetic damage assessments in this tissue are scant. Here, we examine the effects of chemicals on lymphocyte and non-lymphoid tissue in the GIT of mouse pups at three different stages of development. Using the DNA repair enzymes 8-oxoguanine glycosylase (hOGG1) and 3' (T)-8,5'-cyclohygrol (TIMP) as biomarkers of specific DNA lesions and the replication stress markers H2AX and pCHK1(S317), we observed stage-dependent responses. Apoptotic/necrotic cells were also observed in some pups at different times in their development, and a local selective defect in their nuclear response to DNA damage was observed. These effects may be related to expression of the ligase IV enzyme in the developing GIT. The findings reported here support the potential use of mouse pups as a model to study the mechanisms and genetic effects of early-life exposure to mutagens.
