So let's get started. You can export your cheat table to a CSV file (e.g. "sample.csv") in each Cheat Engine version, newer versions use AOBScan. AOBScan allows you to convert your tables into the engine that you need. Simply enter "sample.csv" into the "File > AOB Scan..." window and you will get a CSV file with your cheat table. They are all clean and coded. If you are good at coding, you can add all the features you want in the current title. If you are good at coding, they are all already ready for you. Just search the cheat engine table and copy/paste the functions into your scripts. After that, just run it. If you run out of memory, simply load another project. It's enough for the Custom Game Engine to be able to render the game graphics; it doesn't matter how huge the engine is because the engine size has no relationship with the graphics quality. In addition, you don't have to copy the part of the engine that actually communicates with the game engine. Game code is the same even if you license different companies' engine. The amount of game code you need depends on what kind of game you are going to create. For example, for 2D games, you should copy only the library part of the engine, and the library size will probably be the smaller the game is. You can speed up the process of making a Custom Game Engine by using the Visual Script (VScript) extension. VScript is a visual script editor, it allows users to view, edit, and debug different Visual Script (VScript) files. VScript is also used for making a game in CoH2. The most important feature of VScript is that it can be run with out of the scope of Visual Studio. This means that it can be run outside Visual Studio. Developers who use Visual Studio but still have to edit scripts outside Visual Studio will find it especially useful.

First, decide what you want the game's engine to do and write it in the Visual Script language (VScript). Game engines normally contain a lot of code and the code can be very complicated. Rather than typing the code in by hand, editing the Visual Script can be a very efficient way of developing a game engine. VScript is a visual scripting language, it is not a powerful language like C++, you can understand it quickly because it resembles C#. If you are getting started, it's recommended to start with some simple topics like "airplane", "dog", "pirate", and so on. After determining what game type the game engine should be, it's now time to write the Visual Script corresponding to that game. The Visual Script is required to be followed the format of a Visual Studio script project. In the Visual Script project, there are three types of Visual Script files - Visual Script Editor (.VSX), Code Editor (.CEX), and Line Editor (.LEX). The Visual Script Editor is used to edit the script, the Code Editor is used for viewing the scripts, and the Line Editor is used for viewing and changing the script at runtime, which makes the Visual Script project extremely powerful and flexible.
