HmdiViewer is a free-of-charge, console based software used to control and display graphics for HMDI video sources on embedded platforms. It is designed to work with high definition video sources. If your device is not supported by the included drivers, please report it in the HmdiViewer bug tracker and send a link to your device's HMDI-specific logs: How to use the tool : • You need to plug in your phone and press and hold the power and volume down buttons for 5-10 seconds. Your phone may reboot. • If its successfully flashed, it will beep and lights up. Flashing will also lock the phone and the device will show as read only.• If its doesnt work, verify that: you hold down the power button until it shuts off, then try again (usually resets the phone). You should know what phone model and firmware you have, if its stuck at the wrong firmware then try the step below, it also depends on how the phone is bricked. If the phone doesnt follow the instructions, there is either something wrong with the tool, or there is something wrong with the phone. FLASHING PHONE FRAMEWORKS: Android 4.4.x or older Make sure the phone is fully charged and has a wifi connection. Download the tool and write it to a USB Open the tool on another device Verify the phone is in eMMC/NANDEDL/IDLE/MTD/MDM3(fastboot) If it isnt, go to your phone's manufacturer and get a firmware update. Some tips for that: The device is probably bricked because the user has released a firmware update using a third-party firmware update tool that didnt wipe your current flash, read here for a full list of current official tools. OEMs usually use their own custom firmware. If your phone cannot be flashed because your phone doesnt see the tool (like mentioned above), your only option is to try the third-party tools. Some phone manufacturers like to keep in-house tools to protect the user from invalid firmware. Some devices are bricked by unreleased versions of official firmware. Some of these devices are bricked because they have a hardware button(typically a 'power button') that isnt being detected by the android OS so the device cant reboot unless the user presses the button, in that case the only option is a firmware update. The update usually doesnt wipe your internal flash or other data, some do. While in the EDL mode some manufacturers make the motherboard flash blue and wont be able to get back to the normal firmware, so ask your phone manufacturer first if the phone can be flashed and if the firmware can be flashed at all. If they cant, wait for a future firmware update or use one of the android emmc flashing tools above if you really need to get out of edl. Emmc Software Download App Qualcomm FAQ :
