You work from a network with a single IP address but you have a VPN connection to access other networks (for example, at work) and there are some issues connecting to external sites such as Facebook or Twitter. In other words, you are limited to using a single network and cannot access the outside world from the instance that you are connected. The same principle applies to computers that are locked down by network security solutions. There are different ways to circumvent this but most often, it is simply impossible to access websites that exist outside the network. What's New In Shadowsocks?

Shadowsocks is a secure socks5 proxy that designed to provide a framework for client-server applications in both the TCP and UDP domains to conveniently and securely use the services of a network firewall. Similarly to the Socks5 proxy protocol, the utility enabled you to establish a TCP connection to a random IP address and provides you with a safe method to submit UDP packets. Therefore, the tool makes sure that nobody outside your internal network – including your Internet Service Provider or the LAN administrator – can actually view your traffic. The difference between the two is that the program comes with an encrypted protocol that is slightly simpler to use. To be more precise, after you add your proxy server details and enable your secure connection, you can navigate the Internet in complete anonymity by redirecting the traffic sent and received from your

computer to multiple other servers. All in all, Shadowsocks provides you with a straightforward solution to conceal your real IP address and surf the web privately by just specifying the servers that you want to use. Shadowsocks Installation: First of all, you need to have basic knowledge of Linux. Make sure that you have Administrator privileges on the computer. After that, connect your computer with the internet and navigate to the following download page. There will be two download choices - one for Windows and the other for Linux. After downloading the file, open the software folder and extract the archive to a suitable location. In the end, the extracted files will be saved into the shadowsocks folder. Shadowsocks Shortcut: To access Shadowsocks, you just need to double-click on the shortcut created in the startup folder. All the traffic will be redirected to the proxy servers you have specified. How to use Shadowsocks: 1. First, you need to change the proxy configuration, which is generally stored in the.shadowsocksrc file in the home directory. Open the file and replace the proxy address and proxy server port with your own values, as shown below. 2. Finally, you need to change the proxy settings in the configuration file, which can be achieved by editing the config.json file using your favorite text editor. For example, use the following command to change the settings in the config.json file. At last, start the Shadowsocks application with the following command: $ shadowsocks Once you execute the command, you will find that the proxy settings are automatically applied to the client. Shadowsocks Configuration Files: There are a number of configuration files that can be used to configure the proxy. The file names of these files are as follows: log-stdout.log: This is a log file that is written to your system. Log data will be saved every time you run the application, so that you can monitor the settings of the proxy. config.
