detection of arterial lesions in patients with peripheral arterial occlusive disease, the authors compared sonography with the diagnostic standard of venography and angiography. In an experimental model using freshly killed pigs, duplex sonography was found to be clearly superior to arteriography in all respects. In a retrospective clinical study in 1286 patients, the efficacy of sonography in the evaluation of stenosing arterial occlusive disease of the lower extremities was demonstrated by a sensitivity of more than 93% and a specificity

of more than 90%. The normal and pathological flow velocity waveforms of stenosing arterial occlusive disease were recorded. The Doppler examination also proved to be extremely useful in the follow-up of the efficacy of various treatments.
