the.exe to spawn a pop-up. A HTTP RAT is a popular and well-known RAT. To make things easy, you should perform a  
VirusTotal scan on your executable, to see if it has any more unusual signatures. Also, as you are using Windows, in your

Installer Executable is a standard Windows executable that stores data in a file with the extension.msi. An MSI is a

this function, which returns a vector describing the closest point to a given position. The problem is that it gives the wrong  
answer when I use non-integer coordinates. For example, if I use the coordinates of the point  $P(1/2, 1/2)$  and the point  
 $Q(0, 1/4)$ , it returns the closest point to  $Q$ , which is  $P$ . Can anyone suggest a modification of the function that will  
take care of this problem? def closest_point(x, y): "" Find the vector whose components are the closest to x and y. ""
