For people who use Photoshop for their business, the newly released 20.1 update provides a series of features and enhancements that will make it easier for them to complete all of their marketing and design projects. The 20.1 update - dubbed "Photoshop CS6" among the creative community - introduces a streamlined workspace. It includes an updated Lightroom right-click panel that's superior to the one that shipped in CS6. The Lightroom Control Panel now reflects the adjustments that Photoshop CS6 is making to an image. It's also easier to manage channels and colors with this update; you just click "Open Color Picker." The new PSD panels also employ progress information, and Photoshop Camera Raw users can zoom in throughout a multi-layer Photoshop document. The Capsule feature allows you to save a Photoshop file as a new document. Besides the traditional effect used by the Capsule feature in previous Photoshop releases, you can also add filters to item capsules. You can select not only a filter object, but also any type of object, and every object is isolated on another layer, allowing you to perform advanced compositing without sacrificing layers. The update to Adobe Photoshop CC, Photoshop 20.1, adds a number of new makeovers. It adds the ability to create textures in Fire or Wood, and it's also easier to paint back in an image and edit over it. Admittedly, I haven't used the new features of this update extensively, but whatever I've tried suggests that this version of Photoshop continues to be a rock-solid program.

Post Editing - The post-editing feature is available in Adobe Photoshop and enables users to enhance the appearance of the images and add effects to them. The effect that a user can add in post editing is limited within the pixels of the monitor. If the image whose pixel dimensions are more than the monitor's display it will not be visible to the eye. Post editing is very effective in enhancing the images in general because of its use of layers. Digital Nature - The Digital Nature feature makes it possible to convert the images into another format, e.g. JPEG or TIFF. The image must be saved in any of these formats in order to convert it. Cloning - One of the most valuable features of Photoshop is Cloning. The cloning feature is used to create a perfect image utilizing a similar image as a reference, and also to utilize various editing tools. It is more reliable than manual selection. This feature is also used to remove objects from the image by adjusting the surrounding edges. Texture mapping - The texture mapping feature is used for fine tuning the texture. It has some drawbacks, as it requires more CPU time, but still at a faster speed than manual retouching. This feature cannot be used with the Radial Filter tool. It gives the effect of creating a glass texture with a stippled look. Alpha Channel - The alpha channel is another major feature of Photoshop. The alpha channel enables selective color and transparency adjustments to an image. Alpha channels are created by adding individual channels to a document, and determining settings for each layer.

past year, and some of the new features that have been part of our roadmap for the near future.

"AR is what digital photography was 25 years ago." This was the rallying cry for both Nikon and Leica after they announced their respective new mirrorless cameras (Nikon announced the Nikon Z6 and Leica announced the Leica SL). These devices bring a pair of familiar looking lenses to a busy 21st century setup, which could prove to be a big deal. In the introduction of the Z6 and SL, the companies said that the combination of these new cameras with the premium lenses will deliver "a special new relationship between photographer and subject." Both Nikon and Leica say that the images resulting from these new cameras will look completely different than what we're used to seeing. If this is true, it means that innovation in photo creation could once again be driven by the quest for real-world understanding rather than digital tech. You can expect to see more and more camera technology that looks and feels like an actual camera. When Apple introduced the iPhone, virtually everyone agreed that it was the screen and not the physical hardware that mattered. The consensus at the time among true photographers was that the LCD on the front of the phone didn't matter as long as you could have an app that worked in conjunction with it. That's what matters to photographers. It's what matters to camera manufacturers. It's what validates photography. It wasn't long after the iPhone's launch when smartphones with actual physical controls started to emerge, and now you can expect to see even more of these types of cameras. Apple is already planning to include a 3D FaceTime add-on so that you can see into the camera viewfinder with a single glance. AR is more than just a fun parlor game anymore.
