If I had a dollar for every time I used Photoshop to assemble, then I would be rich. It's so easy to use that even the most awkward beginner can create killer imagery while saving themselves a lot of financial resources. Photoshop CS6 is the best version of the software yet, offering enough new features to make users of previous versions feel like the entire operation is being crammed into the latest release. PDF Guide to Photoshop CS6 Photographer's ToolkitThe in-depth manual is rich with practical, helpful information for the beginner and more experienced user alike. Big names from the publishing and design worlds collaborated on the nearly 400-page tome, which stretches from the basics of slicing photos and adding new layers to more advanced features like cloud storage and special effects. Massive memory management was a problem in the early days. I'd experience greatly varying delays due to Photoshop's memory allocation. While it's improved to the point of near-instantaneous response in the past few years, the gains are probably due only in part to the latest CC release (I'm talking about Photoshop CS5 in this instance), because most of the work on that was done back in Photoshop CS4. Adobe made a few changes to the shadow and lens effects in Lightroom 5. Shadow maintenance is important, but what really concerns me is the so-called lens effect. (They should have called it the 'lens blur' effect.) For example, if you edit your RAW image in Lightroom by applying a Lens Blur, and then you open the file in Photoshop and apply a different Blur, what happens is that the base image in Photoshop is no longer cropped in the same way as the original in Lightroom. This in turn invalidates the entire shot, since that's the only thing that can be compared against the base image. It's like comparing apples to oranges! This is a truly devastating problem, and it's entirely due to the magic of under-the-hood AI (artificial intelligence). There is no way to undo this misinformation caused by AI. This problem invalidates the entire editing process, because what you're really working on is a JPEG and not an original RAW file. The reason for this is so that you can apply a different Blur effect in Photoshop. This leaves no-one in any doubt: AI isn't fail-safe. AI only provides a different interpretation of the RAW data, and no more than that.
